

🗨️ RS001 Week 1 — English Worksheet

Topic: Talking to the Computer — Variables · **Course:** Text Adventure (Python) · **Time:** about 45 minutes

This week you think about how an adventure game talks to the player. The computer **asks** a question with `game.ask()`, **remembers** the answer inside a **variable**, and **shows** it back with `game.say()`. A variable is just a labelled box that holds a value. On this worksheet you read code, predict what it does, fix broken code on paper, and explain the code you wrote in your live lesson.

🗨️ Words to know: **variable, ask, say, f-string, new line**

```
name = game.ask("What is your name?")
game.say(f"Welcome, {name}! Your adventure begins.")
```

1 · Predict 🧠

Read each piece of code. In your head, work out what the screen will show, then write your prediction.

```
hero = game.ask("Hero name?")
game.say(f"Hello {hero}")
```

The player types `Mina`. What appears on screen?

```
hero = game.ask("Hero name?")
game.say("Hello {hero}")
```

This one has no `f` before the quotes. How is the output different from the one above?

```
weapon = game.ask("Pick a weapon")
if weapon == "":
    weapon = "rusty sword"
game.say(f"You hold a {weapon}.")
```

The player just presses enter without typing anything. What weapon do they end up with?
Why?

2 · Spot the Bug 🐛

Each block below was meant to do something, but it is broken. Read what it is **supposed** to do, fix it, then explain why the original was wrong.

Bug A — The code should greet the player by the name they typed. Right now it always prints the word `name` instead of their answer.

```
name = game.ask("What is your name?")
game.say(f"Welcome, name!")
```

Hint: the variable only gets swapped in when it is inside `{ }`.

Write the fixed code:

Why was it wrong? Why does your fix work?

Bug B — If the player types nothing, the game should call them `brave traveller`. Right now an empty answer slips through and the greeting looks empty.

```
name = game.ask("What is your name?")
game.say(f"Welcome, {name}!")
```

Hint: check for an empty answer with `if name == "":` before you say the greeting.

Write the fixed code:

Why was it wrong? Why does your fix work?

Bug C — The intro should print on **three separate lines**. Right now it all runs together on one line.

```
game.say("Welcome! You enter a dark forest. Two paths lie ahead.")
```

Hint: `\n` means "new line". Where would you put it to split the sentence?

Write the fixed code:

Why was it wrong? Why does your fix work?

3 · Explain the Code

Read this working opening program carefully. It asks for a name, uses a default if the player types nothing, and prints a welcome message split across lines.

```
name = game.ask("What is your name?")
if name == "":
    name = "brave traveller"
game.say(f"Welcome, {name}!\nYou enter a dark forest.\nTwo paths lie ahead.")
```

Which line stores the player's answer, and what is the variable called?

What does the `if name == "":` line do, and when does it run?

In the last line, what gets swapped in where `{name}` is written?

There are two `\n` marks in the last line. What do they do to the output?

If the player just presses enter without typing, what name appears on screen?

4 · Explain Your Lesson Code 🎥

In your live lesson you wrote your own opening for your adventure game. Now explain **the code you wrote** in a short video on your phone (or a parent's phone). You may show it running. Talk through it like you are teaching someone who has never seen code, and try to use these words: **variable**, **ask**, **say**, **f-string**, **new line**.

1. Read out the line where you used `ask` to get the player's answer.
2. Point to the **variable** that stores the answer and say its name.
3. Read your `f"..."` line and say how the variable gets swapped in.
4. Show or explain what happens when the player types nothing.

Write what you will say in your video. Plan it here before you record.
