

⚡ WD002 Week 1 — English Worksheet

Topic: Meeting JavaScript — `console.log` and `alert` · **Course:** Web Dev Basics: JavaScript · **Time:** about 45 minutes

This week you make a page **move** for the first time. HTML is the structure, CSS is the look, and **JavaScript is the motion**. You will use `console.log()` to send a message to the console, `alert()` to pop a message at the user, and a button to run your code when it is clicked.

1 · Predict 🧠

Read each piece of code. Before you run it, write what you think will happen.

```
<script>
  console.log("Hello console");
  alert("Hello user");
</script>
```

Two messages appear in two different places. Where does each one show up?

```
<button onclick="sayHi()">Click Me</button>

<script>
  function sayHi() {
    alert("Hi there!");
  }
</script>
```

When does the alert pop up — the moment the page loads, or later? What makes it run?

```
<script>
  console.log("one");
  console.log("two");
  console.log("three");
</script>
```

In what order do the three messages reach the console?

```
<button onclick="greet()">Greet</button>

<script>
  function greet() {
    console.log("greeting...");
    alert("Welcome!");
  }
</script>
```

The button is clicked once. How many things happen, and in what order?

2 · Spot the Bug 🐛

Each block was meant to do something, but it is broken. Read what it is **supposed** to do, then rewrite it so it works. After that, explain why the original was wrong and why your fix works.

Bug A — Clicking the button should pop an alert that says `Hello!`. Right now nothing happens when you click.

```
<button onclick="sayHello()">Click</button>

<script>
  function sayhello() {
    alert("Hello!");
  }
</script>
```

Hint: the button calls one name; the function is spelled another way. JavaScript is picky about capital letters.

Write the fixed code:

Why was it wrong? Why does your fix work?

Bug B — This should show a popup that says `Good job`. Right now the page shows an error.

```
<script>
  alert(Good job);
</script>
```

Hint: text inside `alert()` needs something around it.

Write the fixed code:

Why was it wrong? Why does your fix work?

Bug C — Clicking should print `clicked` to the console. Right now the button does nothing.

```
<button>Press</button>

<script>
  function reportClick() {
    console.log("clicked");
  }
</script>
```

Hint: the function exists, but nothing ever calls it. How does the button know which function to run?

Write the fixed code:

Why was it wrong? Why does your fix work?

3 · Make It Yours

Open a new HTML project on Replit and add a `<script>` tag. Build a button that pops a greeting **with your own name** in it.

1. Make a button on the page.
2. Write a function that runs when the button is clicked.
3. Inside the function, use `alert()` to say hello using your name.
4. Also send a message to the console with `console.log()` so you can see your code ran.

Stretch: add a second button with a *different* message — maybe your favorite food, or a fact about you.

When you finish, come back here. Send a **photo or video** of your page working, then explain what you did. Use these sentence starters — write 4 to 6 sentences total.

First, I added a button that ...

When the button is clicked, my function ...

I used `alert()` to ...

I used `console.log()` to ...

One tricky moment was when ...

If I had more time, I would ...

4 · Record Your Walkthrough 🎥

Take a video on your phone (or a parent's phone) while your page runs. Talk through it like you are teaching someone who has never seen it. Try to use these words: **button**, **function**, **click**, **alert**, **console**.

1. Show your page before clicking anything.
2. Click the button and show the alert popping up.
3. Read your function out loud and say what makes it run.
4. Open the console and show your `console.log` message.

Write what you will say in your video. Plan it here before you record — you can read from it while filming.
