

WD003 Week 7 — English Worksheet

Topic: Contact Form + Smooth Scroll · **Course:** Portfolio Site · **Time:** about 45 minutes

This week you add a **contact form** and **smooth scrolling**. The form has a name field and a message field. When the visitor clicks Send, JavaScript stops the page from reloading, hides the form, and shows a thank-you message. And one line of CSS makes your nav links glide instead of jumping.

`event.preventDefault()` stops the form's default behavior (reloading the page) so *your* code can run instead. `scroll-behavior: smooth` on `html` makes `#` links glide.

1 · Predict 🧠

Read each block of code. Before you imagine the page, write what you think will happen.

```
html { scroll-behavior: smooth; }
```

A visitor clicks a nav link that points to `#contact`. How is the scroll different now compared to before this line?

```
form.addEventListener("submit", function(event) {
  event.preventDefault();
  form.style.display = "none";
  thanks.style.display = "block";
});
```

The visitor fills in the form and clicks Send. List, in order, what happens on the page.

```
<input type="text" id="contactName" placeholder="Name" required>
```

The visitor leaves this field empty and clicks Send. What does **required** do?

2 · Spot the Bug 🐛

Each block of code below was meant to do something, but it is broken. Read what the code is **supposed** to do, then rewrite it so it works. After that, explain why the original was wrong and why your fix works.

Bug A — When the form is submitted, the page is supposed to stay put and show a thank-you message. Right now the whole page reloads and nothing seems to happen.

```
form.addEventListener("submit", function(event) {  
  form.style.display = "none";  
  thanks.style.display = "block";  
});
```

Hint: the form's default action is reloading. One line stops it.

Write the fixed code:

Why was it wrong? Why does your fix work?

Bug B — The thank-you message is supposed to be hidden until the form is sent, then appear. Right now it shows from the very start.

```
<p id="thanks">Thanks, your message has been sent!</p>
```

Hint: it needs to start hidden, and your JavaScript will reveal it later.

Write the fixed code:

Why was it wrong? Why does your fix work?

Bug C — Smooth scrolling is supposed to apply to the whole page when nav links are clicked. Right now it is set on the wrong thing, so nothing glides.

```
button { scroll-behavior: smooth; }
```

Hint: smooth scrolling belongs on the page itself, not on a button.

Write the fixed code:

Why was it wrong? Why does your fix work?

Open your site and finish the Contact section.

1. Build a `<form>` with a **name** `<input>`, a **message** `<textarea>`, and a Send `<button>`.
2. Add a thank-you `<p>` that **starts hidden**.
3. In JavaScript, handle the form's `submit`: call `event.preventDefault()`, hide the form, and show the thank-you message.
4. Add `scroll-behavior: smooth` to `html` and click your nav links to feel the difference.

When you finish, send **photos or a video** of the form before and after you submit it, then explain what you did. Use these sentence starters — write 4 to 6 sentences total.

My contact form has fields for ...

When I click Send, `event.preventDefault()` stops ...

After submitting, the form ...

Smooth scroll made my nav links ...

The hardest part was ...

If I had more time, I would ...

4 · Record Your Walkthrough 🎥

Now take a video on your phone (or a parent's phone) while you use your form and nav. Talk through it like you are teaching someone who has never made a form. Try to use these words: **form**, **submit**, **prevent default**, **smooth scroll**, **message**.

1. Show your contact form and fill it in.
2. Click Send and show the form being replaced by the thank-you message.
3. Read your `preventDefault` line out loud and say why it matters.
4. Click a nav link and show the smooth scroll.

Write what you will say in your video. Use the space below to plan it before you record — you can read from it while filming.
