

Beginner 1 — print() and f-strings

Topic: Showing words on the screen · **Course:** Text Adventure (Python) · **Time:** about 40 minutes

This is your first worksheet. You do not need a computer for most of it. You read code, guess what the screen shows, and fix small mistakes on paper.

Words to know: **print**, **variable**, **f-string**, **quotes**, **output**

```
print("Hello!")                # screen shows: Hello!

name = "Amy"
print(f"Hi {name}")            # screen shows: Hi Amy

print("Hi {name}")             # screen shows: Hi {name}
```

The little **f** is what swaps the box for its value.

1 · Warm Up ○

Which line puts words on the screen? Circle one: `name = "Amy"` · `print("Amy")`

Which line makes a variable? Circle one: `print("hp")` · `hp = 100`

Which line needs an **f** ? Circle one: `print("Hello!")` · `print("Hello {name}")`

2 · Predict 🧙

Read the code. Write exactly what the screen shows.

```
name = "Warrior"  
health = 100  
print(f"{name} has {health} health")
```

What appears on screen?

```
first = "Dark"  
second = "Knight"  
print(first + second)
```

What appears on screen? Look carefully at the spaces.

```
damage = 20  
bonus = 5  
print(f"Total damage: {damage + bonus}")
```

What number appears?

3 · Spot the Bug 🐛

Each one is broken. Write the fixed line.

Bug A — This should show `Hello, Amy!` but it shows `Hello, {name}!`

```
name = "Amy"  
print("Hello, {name}!")
```

Write the fixed line:

Bug B — This should show the word `Sword` but Python gives an error.

```
print(Sword)
```

Write the fixed line:

Bug C — This should show `Level 5` but Python gives an error.

```
level = 5  
print(f"Level {level}")
```

Write the fixed line:

4 · Explain the Code

Read this small program.

```
hero = "Mina"  
potions = 3  
print(f"{hero} the brave")  
print(f"You carry {potions} potions.")
```

Which two lines make a variable? Write their names.

What does `{hero}` turn into on the screen?

How many lines appear on the screen when you run this?

Change `potions` to `7`. What is different on the screen?

5 · Explain Your Lesson Code 🎥

Record a short video on your phone (or a parent's phone). Show the code you wrote in your lesson and talk about it. Try to use these words: **print**, **variable**, **f-string**.

1. Read out one `print` line from your code.
2. Point to a **variable** and say its name.
3. Read an `f"..."` line and say what gets swapped in.
