

RS002 Week 5 — English Worksheet

Topic: Cleaning Input — `.strip()` and `.lower()` · **Course:** Pokédex App · **Time:** about 45 minutes

This week your Pokédex lets the trainer **search by name**. But people type messily — extra spaces, mixed capitals. In the live lesson you cleaned their input with `.strip()` and `.lower()` so the search still works, then used `if` / `elif` / `else` to react to the choice. This worksheet is for **thinking about and explaining that code** — reading it closely, predicting what it does, and putting it into your own words.

💡 Words to know: **strip**, **lower**, **clean**, **search**, **if** / **elif** / **else**

1 · Recall 💡

From memory:

Write a `for` loop that prints every name in a list called `names` .

2 · Predict 🧠

Read each block. Without running it, write what you think will happen.

```
choice = "  Pikachu  "
choice = choice.strip()
print(f"[{choice}]")
```

What prints between the brackets, exactly?

```
choice = "PIKACHU"
choice = choice.lower()
print(choice)
```

What does `.lower()` turn the text into?

```
choice = input("이름: ").strip().lower()

if choice == "pikachu":
    print("⚡ 피카츄!")
else:
    print("없는 포켓몬")
```

The user types `Pikachu`. Does the `if` match? Why or why not?

3 · Spot the Bug 🐛

Read what each block is **supposed** to do, fix it on paper, then explain the fix.

Bug A — This should match even if the user types extra spaces. Right now `" pikachu"` does not match.

```
choice = input("이름: ").lower()

if choice == "pikachu":
    print("찾음!")
else:
    print("못 찾음")
```

Hint: spaces are still there — clean them too.

Write the fixed code:

Why was it wrong? Why does your fix work?

Bug B — This should match whether the user types `Pikachu`, `PIKACHU`, or `pikachu`. Right now only the exact lowercase word works.

```
choice = input("이름: ").strip()

if choice == "pikachu":
    print("찾음!")
else:
    print("못 찾음")
```

Hint: make both sides lowercase before comparing.

Write the fixed code:

Why was it wrong? Why does your fix work?

Bug C — This should show a different message for each of three Pokémon, and one message for anything else. Right now the last branch runs even for known Pokémon.

```
choice = input("이름: ").strip().lower()

if choice == "pikachu":
    print(" ⚡ 피카츄!")
if choice == "bulbasaur":
    print(" 🌿 이상해씨!")
else:
    print("없는 포켓몬")
```

Hint: the second check should be `elif`, not a fresh `if`.

Write the fixed code:

Why was it wrong? Why does your fix work?

4 · Explain the Code

Read this working search carefully. It is the kind of code you built in the live lesson.

```
pokemon_names = ["pikachu", "bulbasaur", "charmander"]
choice = input("Enter Pokémon name: ").strip().lower()

if choice == "pikachu":
    print(" ⚡ 피카츄를 골랐어요!")
elif choice == "bulbasaur":
    print(" 🌿 이상해씨를 골랐어요!")
elif choice == "charmander":
    print(" 🔥 파이리를 골랐어요!")
else:
    print("그 포켓몬은 도감에 없어요.")
```

What do `.strip()` and `.lower()` each do to the trainer's input?

Why are the names in the `if` checks (like `"pikachu"`) written in lowercase?

If the trainer types `BULBASAUR`, which line prints, and why?

When does the `else` branch run?

Why is the second check `elif` and not another `if` ?

5 · Explain Your Lesson Code 🎥

Explain the search code **you wrote in today's lesson** in a short phone video. You may show it running. Teach it like the viewer is new, and try to use: **strip, lower, clean, search, if / elif / else**.

1. Show your search code and run it with a name that has extra spaces and capitals.
2. Point to where you cleaned the input, and say which method fixed the spaces and which fixed the capitals.
3. Read your `if / elif / else` out loud and explain what each branch does.
4. Type a Pokémon that is not in the dex and show the `else` message.

Write what you will say in your video. Plan it here before you record.
