

RS001 Week 3 — English Worksheet

Topic: Lists and Choices · **Course:** Text Adventure (Python) · **Time:** about 45 minutes

This week you think about the **list** — one box that holds many values. You pull a value out by its **index**: the first item is `[0]`, the second is `[1]`, the third is `[2]`. On this sheet you read code, predict it, fix it on paper, and explain the code you wrote in today's lesson.

Words to know: **list**, **index**, **first**, **inventory**, **value**

```
weapons = ["sword", "bow", "wand"]
game.say(f"You can choose: {weapons[0]}, {weapons[1]}, {weapons[2]}")
```

1 · Predict 🧙

Read each piece of code. Run it in your head — do not type it. Write what you think the screen will show.

```
paths = ["left", "middle", "right"]
game.say(paths[1])
```

Which word appears? (Careful — counting starts at 0.)

```
enemies = ["goblin", "orc", "dragon"]
enemy_hp = [10, 25, 100]
game.say(f"{enemies[2]} has {enemy_hp[2]} HP")
```

The two lists share the same index. What sentence is printed?

```
items = ["map", "key", "torch"]  
game.say(items[3])
```

The list has 3 items but the code asks for **[3]**. What goes wrong?

2 · Spot the Bug 🐛

Each block was meant to do something, but it is broken. Read what it is **supposed** to do, fix it on paper, then explain why the original was wrong.

Bug A — This should print the **first** weapon in the list. Right now it prints the second one.

```
weapons = ["sword", "bow", "wand"]
game.say(f"Your first weapon: {weapons[1]}")
```

Hint: the first item is not `[1]`.

Write the fixed code:

Why was it wrong? Why does your fix work?

Bug B — This should show all three paths as a numbered menu. Right now every line shows the **same** path.

```
paths = ["cave", "river", "field"]
game.say(f"1: {paths[0]}")
game.say(f"2: {paths[0]}")
game.say(f"3: {paths[0]}")
```

Hint: lines 2 and 3 should use a different index.

Write the fixed code:

Why was it wrong? Why does your fix work?

Bug C — The enemy name and its HP should belong to the **same** enemy. Right now the name is the goblin but the HP is the dragon's.

```
enemy_names = ["goblin", "orc", "dragon"]
enemy_hp = [10, 25, 100]
game.say(f"A {enemy_names[0]} appears! HP: {enemy_hp[2]}")
```

Hint: the same enemy lives at the same index in both lists.

Write the fixed code:

Why was it wrong? Why does your fix work?

3 · Explain the Code

Here is a working inventory. The hero starts with a **list** of items, and the code shows them on screen.

```
inventory = ["map", "key", "torch"]
game.say(f"You carry: {inventory[0]}, {inventory[1]}, {inventory[2]}")
game.say(f"The first item in your inventory is the {inventory[0]}")
```

What is the name of the list, and what three values are inside it?

`inventory[0]` gives which item? Why that one and not the second?

Which index would you use to show the `torch` ?

The last line says "the first item." What does the word *index* mean in your own words?

4 · Explain Your Lesson Code 🎥

Today in your lesson you wrote your own inventory list. Make a short video on your phone (or a parent's phone) that explains the code **you** wrote. You may show it running. Teach it like the viewer has never coded. Try to use these words: **list, index, first, inventory, value**.

1. Point to the list you wrote and read the items out loud.
2. Pick one item and say its index.
3. Explain why the first item is index 0, not 1.
4. Say one thing that was tricky and how you worked it out.

Write what you will say in your video. Plan it here before you record.
