

RS001 Week 2 — English Worksheet

Topic: Variables Go Deeper — A Rich Opening · **Course:** Text Adventure (Python) · **Time:** about 45 minutes

This week you keep last week's code and **add more variables**. Your hero gets a name, a weapon, and a hometown — and your opening scene grows. Every variable that could be empty gets a safe default.

```
hero = game.ask("Hero's name?")
if hero == "":
    hero = "brave traveller"

weapon = game.ask("Starting weapon?")
if weapon == "":
    weapon = "rusty sword"

game.say(f"{hero}, you grip your {weapon} and set out.")
```

1 · Predict 🧠

Read each piece of code. Before you run it in your head, write what you think the screen will show.

```
hero = "Mina"
weapon = "bow"
game.say(f"{hero} draws a {weapon}.")
```

What single line appears on screen?

```
hometown = game.ask("Hometown?")
if hometown == "":
    hometown = "a village with no name"
game.say(f"You came from {hometown}.")
```

The player types nothing. What town name ends up in the sentence?

```
hero = game.ask("Hero?")
if hero == "":
    hero = "brave traveller"
game.say(f"=== The Adventure Begins ===\n{hero}, your story starts now.")
```

There is a `\n` in the middle. Sketch how the two lines look on screen.

2 · Spot the Bug 🐛

Each block was meant to do something, but it is broken. Read what it is **supposed** to do, fix it, then explain why the original was wrong.

Bug A — Three variables (`hero` , `weapon` , `hometown`) should all appear in the final sentence. Right now `weapon` is spelled differently in two places, so it crashes.

```
weapon = game.ask("Weapon?")
game.say(f"You carry a {weopon}.")
```

Hint: the name you store with and the name you print with must match **exactly**.

Write the fixed code:

Why was it wrong? Why does your fix work?

Bug B — Every variable should fall back to a default when the player types nothing. Right now only `hero` is protected; `weapon` is left unsafe.

```
hero = game.ask("Hero?")
if hero == "":
    hero = "brave traveller"

weapon = game.ask("Weapon?")
game.say(f"{hero} holds a {weapon}.")
```

Hint: `weapon` needs its own `if ... == "":` check.

Write the fixed code:

Why was it wrong? Why does your fix work?

Bug C — The empty-check should match a truly **empty** answer. Right now it checks for a single space, so an empty answer is not caught.

```
name = game.ask("Name?")
if name == " ":
    name = "brave traveller"
game.say(f"Welcome, {name}.")
```

Hint: `""` means nothing typed; `" "` means one space. Which one do you want here?

Write the fixed code:

Why was it wrong? Why does your fix work?

3 • 🎯 Grow Your Opening

Open your game from last week. **Do not delete it.** On top of it, add:

- a **weapon** variable and a **hometown** variable, each with a safe default,
- one variable of **your own** (favourite colour, animal, food ...) that appears in the opening,
- a multi-line opening that uses all your variables.

When it works, send a **photo or video**, then explain what you did. Use these sentence starters — write 4 to 6 sentences total.

First, I kept last week's code and added ...

My own extra variable was ...

I gave every variable a default so that ...

I made the opening easier to read by ...

One tricky moment was when ...

If I had more time, I would ...

4 · Record Your Walkthrough

Take a video on your phone (or a parent's phone) while your opening runs. Teach it like the viewer has never coded. Try to use these words: **variable**, **default**, **empty**, **f-string**, **opening**.

1. Run your opening and answer your own questions.
2. Point to each variable and say what it stores.
3. Show what happens when you leave one answer empty.
4. Read your final sentence and say which variables got swapped in.

Write what you will say in your video. Plan it here first.
