

RS002 Week 10 — English Worksheet

Topic: Expanding the Dex — Evolution + Region Keys · **Course:** Pokédex App · **Time:** about 45 minutes

This week each Pokémon grows from 4 facts to **7**: you add `evolution`, `region`, and `description` keys. Because you are using dictionaries now, adding facts is easy — no new parallel lists to keep in sync. You also write a helper that prints a full Pokémon card, and filter the dex by region.

1 · Recall

From memory:

Write a single Pokémon as a dictionary with keys `name`, `type`, `hp`, and `attack`, then print its name.

2 · Predict 🧠

Read each block. Before you run it, write what you think will happen.

```
pikachu = {"name": "피카츄", "region": "관동", "evolution": "라이츄"}
print(f"{pikachu['name']} → {pikachu['evolution']} ({pikachu['region']})")
```

What single line prints?

```
pokedex = [
    {"name": "피카츄", "region": "관동"},
    {"name": "롱스톤", "region": "성도"},
    {"name": "꼬부기", "region": "관동"},
]

for p in pokedex:
    if p["region"] == "관동":
        print(p["name"])
```

Which names print? Why?

```
def show(p):
    print(f"=== {p['name']} ===")
    print(f"타입: {p['type']}")

show({"name": "파이리", "type": "불"})
```

The function takes a dictionary `p`. What does it print?

3 · Spot the Bug 🐛

Read what each block is **supposed** to do, fix it, then explain the fix.

Bug A — Every Pokémon should have the same keys. This one is missing `region`, so the loop crashes when it reaches it.

```
pokedex = [  
    {"name": "피카츄", "region": "관동"},  
    {"name": "이상해씨"},  
]  
  
for p in pokedex:  
    print(f"{p['name']} - {p['region']}")
```

Hint: add the missing key to the second Pokémon.

Write the fixed code:

Why was it wrong? Why does your fix work?

Bug B — This filter should show only `관동` Pokémon. Right now it shows all of them.

```
pokedex = [  
    {"name": "피카츄", "region": "관동"},  
    {"name": "롱스톤", "region": "성도"},  
]  
  
for p in pokedex:  
    print(p["name"])
```

Hint: add an `if` that checks the region before printing.

Write the fixed code:

Why was it wrong? Why does your fix work?

Bug C — The card function should print the `description`. The key is spelled wrong, causing a `KeyError`.

```
def show(p):  
    print(f"=== {p['name']} ===")  
    print(f"설명: {p['describe']}")  
  
show({"name": "피카츄", "description": "전기 쥐 포켓몬"})
```

Hint: the key in the data is `description`.

Write the fixed code:

Why was it wrong? Why does your fix work?

4 · Modify It

Start from this working full-card helper:

```
pokedex = [  
    {  
        "name": "피카츄", "type": "전기", "hp": 35, "attack": 55,  
        "evolution": "라이츄", "region": "관동",  
        "description": "전기를 모으는 쥐 포켓몬. 볼이 빨개지면 위험!"  
    },  
    {  
        "name": "이상해씨", "type": "풀", "hp": 45, "attack": 49,  
        "evolution": "이상해풀", "region": "관동",  
        "description": "등에 식물 씨앗을 지고 다닙니다."  
    },  
]  
  
def show_full(pokemon):  
    print(f"\n=== {pokemon['name']} ({pokemon['region']}) ===")  
    print(f"타입: {pokemon['type']} | 진화: {pokemon['evolution']}")  
    print(f"체력: {pokemon['hp']} | 공격력: {pokemon['attack']}")  
    print(f"설명: {pokemon['description']}")  
    print("=" * 40)  
  
show_full(pokedex[0])
```

Make these changes one at a time and run after each:

1. Call `show_full` on the **second** Pokémon too.
2. Add a `"weight"` key to both Pokémon and print it inside `show_full`.
3. Loop over the whole dex and call `show_full` on every Pokémon.

Write your changed / added lines here:

5 · Make It

Grow your Week 9 dex so every Pokémon has all **seven keys** (`name` , `type` , `hp` , `attack` , `evolution` , `region` , `description`). Have **at least eight Pokémon**. Add a "view by region" feature that lists only the Pokémon from a chosen region.

When it works, send a **photo or video** on KakaoTalk, then explain what you did. Use these starters — write 4 to 6 sentences.

First, I added the keys ... to every Pokémon.

Adding facts was easy because dictionaries let me ...

My region filter worked by ...

My `show_full` helper printed ...

The trickiest part was ...

If I had more time, I would add the key ...

6 · Record Your Walkthrough 🎥

Film it running. Teach it like the viewer is new. Try to use: **key**, **dictionary**, **filter**, **region**, **KeyError**.

1. Show one Pokémon with all seven keys and read them out loud.
2. Run the "view by region" feature for one region.
3. Explain why adding a key is easier than adding a fifth parallel list.
4. Show what happens (or could happen) if one Pokémon is missing a key.

Plan what you will say here first:
