

RS001 Week 2 — English Worksheet

Topic: Variables Go Deeper — A Rich Opening · **Course:** Text Adventure (Python) · **Time:** about 45 minutes

This week you think about how more variables make an opening richer. Your hero gets a name, a weapon, and a hometown, and every variable that could be empty gets a safe default. You will read the code, debug it on paper, and explain the code you wrote in your live lesson.

Words to know: **variable**, **default**, **empty**, **f-string**, **opening**

```
hero = game.ask("Hero's name?")
if hero == "":
    hero = "brave traveller"

weapon = game.ask("Starting weapon?")
if weapon == "":
    weapon = "rusty sword"

game.say(f"{hero}, you grip your {weapon} and set out.")
```

1 · Predict 🧠

Read each piece of code. Run it in your head and write what you think the screen will show.

```
hero = "Mina"
weapon = "bow"
game.say(f"{hero} draws a {weapon}.")
```

What single line appears on screen?

```
hometown = game.ask("Hometown?")
if hometown == "":
    hometown = "a village with no name"
game.say(f"You came from {hometown}.")
```

The player types nothing. What town name ends up in the sentence?

```
hero = game.ask("Hero?")
if hero == "":
    hero = "brave traveller"
game.say(f"=== The Adventure Begins ===\n{hero}, your story starts now.")
```

There is a `\n` in the middle. Sketch how the two lines look on screen.

2 · Spot the Bug 🐛

Each block was meant to do something, but it is broken. Read what it is **supposed** to do, fix it on paper, then explain why the original was wrong.

Bug A — Three variables (`hero` , `weapon` , `hometown`) should all appear in the final sentence. Right now `weapon` is spelled differently in two places, so it crashes.

```
weapon = game.ask("Weapon?")
game.say(f"You carry a {weopon}.")
```

Hint: the name you store with and the name you print with must match **exactly**.

Write the fixed code:

Why was it wrong? Why does your fix work?

Bug B — Every variable should fall back to a default when the player types nothing. Right now only `hero` is protected; `weapon` is left unsafe.

```
hero = game.ask("Hero?")
if hero == "":
    hero = "brave traveller"

weapon = game.ask("Weapon?")
game.say(f"{hero} holds a {weapon}.")
```

Hint: `weapon` needs its own `if ... == "":` check.

Write the fixed code:

Why was it wrong? Why does your fix work?

Bug C — The empty-check should match a truly **empty** answer. Right now it checks for a single space, so an empty answer is not caught.

```
name = game.ask("Name?")
if name == " ":
    name = "brave traveller"
game.say(f"Welcome, {name}.")
```

Hint: `""` means nothing typed; `" "` means one space. Which one do you want here?

Write the fixed code:

Why was it wrong? Why does your fix work?

3 · Explain the Code

Read this working opening carefully. It asks for two variables, gives each a safe default, then prints one sentence.

```
hero = game.ask("Hero's name?")
if hero == "":
    hero = "brave traveller"

weapon = game.ask("Starting weapon?")
if weapon == "":
    weapon = "rusty sword"

game.say(f"{hero}, you grip your {weapon} and set out.")
```

What does the variable **hero** store after the player answers?

What happens when the player leaves the weapon answer empty?

Why does the last line use an **f** before the quotes?

Which two values get swapped into the final sentence?

Why is it useful to give each variable a default?

4 · Explain Your Lesson Code 🎥

Explain the code **you wrote in today's live lesson**. Take a short video on your phone (or a parent's phone) and walk through your own opening. You may show it running. Teach it like the viewer has never coded, and use these words: **variable**, **default**, **empty**, **f-string**, **opening**.

1. Point to each variable you made and say what it stores.
2. Show which variables have a default and explain why.
3. Show what happens when you leave one answer empty.
4. Read your final sentence and say which variables got swapped in.

Write what you will say in your video. Plan it here before you record.
