

RS002 Week 10 — English Worksheet

Topic: Expanding the Dex — Evolution + Region Keys · **Course:** Pokédex App · **Time:** about 45 minutes

This week is about **reading and explaining** the code that grows each Pokémon from 4 facts to **7** — adding the `evolution`, `region`, and `description` keys. You will think through how dictionaries make adding facts easy, trace a full-card helper, and explain the code you wrote in your live lesson out loud.

Words to know: **key**, **dictionary**, **filter**, **region**, **KeyError**

1 · Recall

From memory:

Write a single Pokémon as a dictionary with keys `name`, `type`, `hp`, and `attack`, then print its name.

2 · Predict 🧠

Read each block. Write what you think will happen.

```
pikachu = {"name": "피카츄", "region": "관동", "evolution": "라이츄"}
print(f"{pikachu['name']} → {pikachu['evolution']} ({pikachu['region']})")
```

What single line prints?

```
pokedex = [
    {"name": "피카츄", "region": "관동"},
    {"name": "롱스톤", "region": "성도"},
    {"name": "꼬부기", "region": "관동"},
]

for p in pokedex:
    if p["region"] == "관동":
        print(p["name"])
```

Which names print? Why?

```
def show(p):
    print(f"=== {p['name']} ===")
    print(f"타입: {p['type']}")

show({"name": "파이리", "type": "불"})
```

The function takes a dictionary `p`. What does it print?

3 · Spot the Bug 🐛

Read what each block is **supposed** to do, fix it on paper, then explain the fix.

Bug A — Every Pokémon should have the same keys. This one is missing `region`, so the loop crashes when it reaches it.

```
pokedex = [  
    {"name": "피카츄", "region": "관동"},  
    {"name": "이상해씨"},  
]  
  
for p in pokedex:  
    print(f"{p['name']} - {p['region']}")
```

Hint: add the missing key to the second Pokémon.

Write the fixed code:

Why was it wrong? Why does your fix work?

Bug B — This filter should show only `관동` Pokémon. Right now it shows all of them.

```
pokedex = [  
    {"name": "피카츄", "region": "관동"},  
    {"name": "롱스톤", "region": "성도"},  
]  
  
for p in pokedex:  
    print(p["name"])
```

Hint: add an `if` that checks the region before printing.

Write the fixed code:

Why was it wrong? Why does your fix work?

Bug C — The card function should print the `description`. The key is spelled wrong, causing a `KeyError`.

```
def show(p):  
    print(f"=== {p['name']} ===")  
    print(f"설명: {p['describe']}")  
  
show({"name": "피카츄", "description": "전기 쥐 포켓몬"})
```

Hint: the key in the data is `description`.

Write the fixed code:

Why was it wrong? Why does your fix work?

4 · Explain the Code

Read this working full-card helper carefully.

```
pokedex = [  
    {  
        "name": "피카츄", "type": "전기", "hp": 35, "attack": 55,  
        "evolution": "라이츄", "region": "관동",  
        "description": "전기를 모으는 쥐 포켓몬. 불이 빨개지면 위험!"  
    },  
    {  
        "name": "이상해씨", "type": "풀", "hp": 45, "attack": 49,  
        "evolution": "이상해풀", "region": "관동",  
        "description": "등에 식물 씨앗을 지고 다닙니다."  
    },  
]  
  
def show_full(pokemon):  
    print(f"\n=== {pokemon['name']} ({pokemon['region']}) ===")  
    print(f"타입: {pokemon['type']} | 진화: {pokemon['evolution']}")  
    print(f"체력: {pokemon['hp']} | 공격력: {pokemon['attack']}")  
    print(f"설명: {pokemon['description']}")  
    print("=" * 40)  
  
show_full(pokedex[0])
```

How many keys does each Pokémon dictionary have? Name them.

The function uses `pokemon['region']`. What is `region` here — a key or a value?

`show_full(pokedex[0])` runs once. Which Pokémon's card prints, and why that one?

If a Pokémon was missing the `evolution` key, which line would crash, and what error would Python give?

Why is adding a new fact (like `weight`) to every Pokémon easier with dictionaries than with separate parallel lists?

5 · Explain Your Lesson Code 🎥

Explain the code **you wrote in today's lesson** in a short phone video. You may show it running. Teach it like the viewer is new, and use these words: **key**, **dictionary**, **filter**, **region**, **KeyError**.

1. Show one Pokémon from your dex with all seven keys and read them out loud.
2. Run your "view by region" feature for one region and explain how the filter chooses which Pokémon to show.
3. Explain why adding a key is easier than adding a fifth parallel list.
4. Show what happens (or could happen) if one Pokémon is missing a key.

Write what you will say in your video. Plan it here before you record.
