

● RS002 Week 16 — English Worksheet

Topic: Final Polish + Presentation · **Course:** Pokédex App · **Time:** about 45 minutes

This is the last week. You bring **everything** — intro, list, search, battle, tournament, two files — together into one menu-driven Pokédex app, polish it, and prepare a **5-minute demo** to present to your friends. Nothing new to learn; everything to combine.

1 · Recall

From memory:

Write the two `import` lines a `main.py` needs: one for the random module, one to bring in `pokedex` from `pokemon_data`.

2 · Predict 🧠

Read each block. Before you run it, write what you think will happen.

```
def main_menu():  
    print("1. 도감 보기")  
    print("2. 종료")  
    return input("선택: ").strip()  
  
choice = main_menu()  
print(f"고른 것: {choice}")
```

`main_menu` both prints and returns. The user types `1`. What prints in total?

```
while True:  
    choice = input("선택: ").strip()  
    if choice == "5":  
        print("종료합니다")  
        break  
    else:  
        print("계속")
```

The user types `2`, then `5`. What happens each round?

```
pokedex = [{"name": "피카츄"}, {"name": "파이리"}, {"name": "꼬부기"}]  
print(f"{len(pokedex)}마리 등록")
```

What single line prints?

3 · Spot the Bug 🐛

Read what each block is **supposed** to do, fix it, then explain the fix.

Bug A — The menu loop should keep running until `5`. Right now it breaks on **every** choice because `break` is outside the `if`.

```
while True:
    choice = input("선택: ").strip()
    if choice == "1":
        print("도감 보기")
    break
```

Hint: the `break` should only run when the user picks quit.

Write the fixed code:

Why was it wrong? Why does your fix work?

Bug B — `main_menu` should hand the choice back to the loop. Right now it prints the choice but returns nothing, so the loop never sees it.

```
def main_menu():
    print("1. 도감 보기")
    print("2. 종료")
    choice = input("선택: ").strip()
    print(choice)

c = main_menu()
if c == "2":
    print("종료")
```

Hint: `return` the choice.

Write the fixed code:

Why was it wrong? Why does your fix work?

Bug C — When the user picks an option that does not exist, the app should say so. Right now unknown input silently loops with no feedback.

```
while True:
    choice = input("선택: ").strip()
    if choice == "1":
        print("도감 보기")
    elif choice == "5":
        break
```

Hint: add an `else` for anything that is not a valid option.

Write the fixed code:

Why was it wrong? Why does your fix work?

4 · Modify It

Start from this near-final app (`main.py` , using `pokemon_data.py` from last week):

```

import random
from pokemon_data import pokedex

def main_menu():
    print("\n=== 메인 메뉴 ===")
    print("1. 도감 보기")
    print("2. 검색")
    print("3. 배틀!")
    print("4. 종료")
    return input("선택: ").strip()

def list_pokedex(pokedex):
    for i, p in enumerate(pokedex):
        print(f" #{i+1} {p['name']} 타입:{p['type']}")

def search_pokedex(pokedex):
    kw = input("검색어: ").strip().lower()
    found = [p for p in pokedex if kw in p["name"].lower()]
    for p in found:
        print(f" {p['name']} ({p['type']}) - HP:{p['hp']} ATK:{p['attack']}")
    if not found:
        print(" 결과 없음")

def quick_battle(pokedex):
    my_p = random.choice(pokedex)
    enemy = random.choice(pokedex)
    print(f"\n{my_p['name']} vs {enemy['name']}")
    if my_p["hp"] + my_p["attack"] > enemy["hp"] + enemy["attack"]:
        print(f" 🏆 {my_p['name']} 승리!")
    else:
        print(f" 😞 {enemy['name']} 승리...")

trainer = input("트레이너 이름: ").strip() or "이름 모를 트레이너"
print(f"\n환영합니다, {trainer} 트레이너님! ({len(pokedex)}마리 등록)\n")

while True:
    choice = main_menu()
    if choice == "1":
        list_pokedex(pokedex)
    elif choice == "2":
        search_pokedex(pokedex)
    elif choice == "3":
        quick_battle(pokedex)
    elif choice == "4":
        print(f"\n또 만나요, {trainer} 트레이너님!")

```

```
        break
    else:
        print("1~4 중에서 골라주세요.")
```

Make these changes one at a time and run after each:

1. Add a **5. 토너먼트** option that calls your Week 14 tournament function.
2. Add an ASCII-art logo that prints once when the app starts.
3. Make the goodbye line show how many Pokémon were registered.

Write your changed / added lines here:

5 • Make It

Assemble your **final Pokédex app**: a menu loop offering list, search, battle, and tournament, reading data from `pokemon_data.py`. Polish the wording and layout so it feels finished. Then prepare a **5-minute demo**.

When it works, send a **video** on KakaoTalk of the whole app running, **both files**, and your **presentation notes**. Then explain what you did. Use these starters — write 4 to 6 sentences.

First, I combined ... into one menu app.

The function I am most proud of is ... because ...

Splitting into two files helped me ...

The hardest problem this term was ... and I solved it by ...

The feature I would add next is ...

Two weeks ago I could not ... but now I can ...

6 · Present It

Prepare a **5-minute demo** for your friends. Use this checklist — tick each before you present:

- ☐ Run the Pokédex app from start to finish once.
- ☐ Explain one or two functions you are most proud of.
- ☐ Explain why splitting into two files helped.
- ☐ Share the hardest problem you hit and how you solved it.

Write your presentation script here. You can read from it while presenting and while you record.

Submit 

Send your finished app **video**, **both code files**, and your **presentation notes** to teacher on KakaoTalk.
