

⚡ WD002 Week 4 — English Worksheet

Topic: User Input — Talking with Input Boxes · **Course:** Web Dev Basics: JavaScript · **Time:** about 45 minutes

This week the user gets to **type**. An `<input>` box collects text, and `.value` reads whatever is inside it. You will grab that value, save it in a variable, show it on the page — and politely warn the user when the box is empty.

1 · Predict 🧠

Read each piece of code. Before you run it, write what you think will happen.

```
<input id="nameBox" type="text">
<button id="show">Show</button>

<script>
  document.querySelector("#show").addEventListener("click", function() {
    let name = document.querySelector("#nameBox").value;
    console.log(name);
  });
</script>
```

The user types `Jiwoo` and clicks Show. What prints to the console?

```
<input id="nameBox" type="text">
<h1 id="out"></h1>

<script>
  document.querySelector("#go").addEventListener("click", function() {
    let name = document.querySelector("#nameBox").value;
    document.querySelector("#out").textContent = "Hi, " + name + "!";
  });
</script>
```

The user types **Ari** . What full sentence ends up on the screen?

```
<script>
  let name = document.querySelector("#nameBox").value;
  if (name === "") {
    alert("Please type something");
  }
</script>
```

The user clicks without typing anything. What happens?

```
<input id="ageBox" type="text">

<script>
  let age = document.querySelector("#ageBox").value;
  console.log(age + 1);
</script>
```

The user types **10** . You might expect **11** . What actually prints, and why? (Hint: **.value** is always text.)

2 · Spot the Bug 🐛

Each block was meant to do something, but it is broken. Read what it is **supposed** to do, then rewrite it so it works. After that, explain why the original was wrong and why your fix works.

Bug A — Clicking should show what the user typed. Right now it always shows the **same** word, no matter what is typed.

```
<input id="nameBox" type="text">
<h1 id="out"></h1>

<script>
  document.querySelector("#show").addEventListener("click", function() {
    document.querySelector("#out").textContent = "nameBox";
  });
</script>
```

Hint: the code shows the text `"nameBox"`, not the box's `.value`. Read the value first.

Write the fixed code:

Why was it wrong? Why does your fix work?

Bug B — This should warn the user when the box is empty. Right now the warning shows even when they *did* type something.

```
<script>
  let name = document.querySelector("#nameBox").value;
  if (name = "") {
    alert("Box is empty!");
  }
</script>
```

Hint: one equals sign *sets* a value; you want to *compare*. How many equals signs do you need to check if two things are the same?

Write the fixed code:

Why was it wrong? Why does your fix work?

Bug C — This should add two numbers the user types. Right now typing **3** and **4** gives **34** instead of **7**.

```
<script>
  let a = document.querySelector("#num1").value;
  let b = document.querySelector("#num2").value;
  console.log(a + b);
</script>
```

Hint: **.value** hands you text, so **+** glues the text together. Turn each value into a number first with **Number(...)**.

Write the fixed code:

Why was it wrong? Why does your fix work?

Build a page that asks for a **name** and an **age**, then shows a short introduction.

1. Add two input boxes and a button.
2. When the button is clicked, read both values with `.value`.
3. Show a sentence like `Hi, I'm ____ and I'm ____ years old.` on the page.
4. If **either** box is empty, show a warning instead of the sentence.

Stretch: add the age to a number (for example, show "Next year you'll be ___") — remember to turn the value into a **Number** first.

When you finish, come back here. Send a **photo or video** of both a filled-in result and the empty-box warning, then explain what you did. Use these sentence starters — write 4 to 6 sentences total.

First, I made input boxes for ...

I used `.value` to ...

To check for an empty box, I ...

When both boxes are filled, the page shows ...

One tricky moment was when ...

If I had more time, I would ...

4 · Record Your Walkthrough 🎥

Take a video on your phone (or a parent's phone) while your page runs. Talk through it like you are teaching someone who has never seen it. Try to use these words: **input**, **value**, **empty**, **warning**, **variable**.

1. Show the empty boxes, then type into them.
2. Click the button and show the introduction appear.
3. Clear a box and show the warning.
4. Read one line out loud and say where it reads the value.

Write what you will say in your video. Plan it here before you record — you can read from it while filming.
