

↔ Extra — CSS Flexbox Layout

Topic: Flex Container, Direction & Spacing · **Course:** Extra Worksheet · **Time:** about 30 minutes

One line — `display: flex` — turns a box into a **flex container**. The boxes inside it become **flex items** and line up in a row. Then you steer them: `justify-content` slides them along the row, `align-items` moves them up and down, and `gap` puts space between them. On paper you will read Flexbox, predict it, fix it, and explain it in your own words.

Keep these words handy: **flex container**, **flex item**, **flex-direction**, **justify-content**, **align-items**, **gap**.

1 · Predict 🌟

Read each snippet. Write what you think the page will look like.

```
<style>
  .container { display: flex; }
</style>
<div class="container">
  <div class="box">A</div>
  <div class="box">B</div>
  <div class="box">C</div>
</div>
```

Without `display: flex`, A, B and C stack one per line. With it, where do they go?

```
<style>
  .container {
    display: flex;
    flex-direction: column;
  }
</style>
```

The same three boxes. What does **column** do to them?

```
<style>
  .container {
    display: flex;
    justify-content: space-between;
  }
</style>
```

Three boxes, one wide container. Where does the empty space go?

2 · Spot the Bug 🐛

Each snippet is broken. Read what it should do, then rewrite it so it works. Explain why the original was wrong.

Bug A — The boxes should sit side by side. They stay stacked.

```
.container { flex; }
```

Hint: `flex` is the value. Something is missing in front of it.

Write the fixed code:

Why was it wrong? Why does your fix work?

Bug B — The boxes are in a row but squashed together. There should be 24px between them.

```
.container {  
  display: flex;  
  gap 24px;  
}
```

Hint: every property needs a `:` between it and its value.

Write the fixed code:

Why was it wrong? Why does your fix work?

Bug C — The three boxes should spread across the row. Nothing moves.

```
<div class="container">
  <div class="box" style="justify-content: space-between;">A</div>
  <div class="box">B</div>
  <div class="box">C</div>
</div>
```

Hint: `justify-content` is a rule for the **container**, not for one item.

Write the fixed code:

Why was it wrong? Why does your fix work?

3 · Explain the Code 📖

This is the centred toolbar from your lesson.

```
<style>
  .toolbar {
    height: 90px;
    display: flex;
    justify-content: center;
    align-items: center;
    gap: 16px;
    background: #1f2937;
  }
  .btn {
    padding: 10px 18px;
    background: #f97316;
    color: white;
    border-radius: 6px;
  }
</style>
<div class="toolbar">
  <button class="btn">Cut</button>
  <button class="btn">Copy</button>
  <button class="btn">Paste</button>
</div>
```

justify-content — moves items along this way ↔

↕ **align-items** — moves items this way

the gaps between the buttons = **gap: 16px**

Which box is the flex container — **.toolbar** or **.btn** ? How do you know?

`justify-content: center` and `align-items: center` both say `center` . What is different about the two?

If you deleted `gap: 16px` , what would change? What would stay the same?
