

RS001 Week 5 — English Worksheet

Topic: Handling the Player's Choice — Cleaning Input · **Course:** Text Adventure (Python) · **Time:** about 45 minutes

This week is about thinking through how a game becomes forgiving. Players type messy answers — extra spaces, capital letters. `.strip()` removes spaces from the ends, and `.lower()` makes everything lowercase, so `" Left "`, `"LEFT"`, and `"left"` all match. You will read code, fix code on paper, and explain the code you wrote in your live lesson.

Words to know: **strip**, **lower**, **clean**, **spaces**, **lowercase**

```
choice = game.ask("Pick a path (left/right)")
choice = choice.strip().lower()
if choice == "left":
    game.say("You enter the dark cave...")
```

1 · Predict 🧠

Read each piece of code. In your head, work out what happens, then write your answer.

```
choice = " left "
choice = choice.strip()
game.say(f"[{choice}]" )
```

The square brackets show exactly what is stored. What is printed inside them?

```
choice = "LEFT"
choice = choice.lower()
game.say(choice)
```

What word appears on screen?

```
choice = game.ask("left or right?")
if choice == "left":
    game.say("cave")
else:
    game.say("field")
```

The player types `left` with spaces around it. Which message shows — and is that what they wanted?

2 · Spot the Bug 🐛

Each block was meant to do something, but it is broken. Read what it is **supposed** to do, fix it on paper, then explain why the original was wrong.

Bug A — A player who types `"Left"` should be sent to the cave. Right now only an exact lowercase `"left"` works.

```
choice = game.ask("left or right?")
if choice == "left":
    game.say("You enter the cave.")
else:
    game.say("You walk into the field.")
```

Hint: clean the answer with `.lower()` before you compare it.

Write the fixed code:

Why was it wrong? Why does your fix work?

Bug B — The cleaned answer should be **saved**. Right now `.strip()` runs but the spaces come back, because the result was thrown away.

```
choice = game.ask("left or right?")
choice.strip()
if choice == "left":
    game.say("Cave!")
```

Hint: `.strip()` makes a clean copy — you have to store it back into the variable.

Write the fixed code:

Why was it wrong? Why does your fix work?

Bug C — This should accept `"Right"`, `"RIGHT"`, and `" right "` all the same. Right now it cleans the spaces but not the capitals.

```
choice = game.ask("left or right?")
choice = choice.strip()
if choice == "right":
    game.say("Field!")
```

Hint: add one more cleaning step after `.strip()`.

Write the fixed code:

Why was it wrong? Why does your fix work?

3 · Explain the Code

Read this working example. It asks the player for a path, cleans the answer, then reacts differently depending on what they chose.

```
choice = game.ask("Pick a path (left/right)")
choice = choice.strip().lower()
if choice == "left":
    game.say("You enter the dark cave...")
else:
    game.say("You walk into the open field.")
```

What does `game.ask(...)` give back, and where is it stored?

The line `choice = choice.strip().lower()` does two cleaning jobs. What does each part do?

Why does the cleaning line come before the `if`, and not after?

The player types `LEFT` with capitals and spaces. After cleaning, what is stored in `choice` ?

Which message shows for that player, and why?

4 · Explain Your Lesson Code 🎥

In your live lesson you wrote code that cleans the player's choice. Now explain *your own* code in a short video on your phone (or a parent's phone). You may show it running. Teach it like the viewer has never coded, and use these key words: **strip, lower, clean, spaces, lowercase**.

1. Show the line where you ask the player for their choice.
2. Point to the cleaning step and explain what `.strip()` and `.lower()` each do.
3. Run it once with a clean answer, then once with CAPS and extra spaces, and show both give the same result.
4. Explain in your own words why cleaning the input matters.

Write what you will say in your video. Plan it here before you record.
