

RS002 Week 2 — English Worksheet

Topic: Trainer Profile — More Variables · **Course:** Pokédex App · **Time:** about 45 minutes

Words to know: **variable, strip, default, field, trainer card**

This week you read and think about a full **trainer card**. It asks for more details — region and favourite type — cleans each answer with `.strip()`, gives every answer a default, and prints a tidy card. You will trace the code on paper, fix some bugs in your head, and then explain the code you wrote in the live lesson.

1 · Recall

From memory — no peeking at Week 1:

Write the line that asks the user for their name and stores it in `trainer_name`.

Write the line that prints `환영합니다, 지우 트레이너님!` using an f-string (the name is in `trainer_name`).

2 · Predict 🧠

Read each block. Write what you think will happen — no need to run it.

```
region = input("어느 지역에서 오셨나요? ").strip()
print(f"[{region}]")
```

The user types **관동** (with spaces before and after). What prints between the brackets, exactly?

```
fav_type = input("좋아하는 타입은? ").strip()
if fav_type == "":
    fav_type = "비밀"
print(f"선호 타입: {fav_type}")
```

The user presses Enter without typing. What is printed?

```
print(f"이름: {trainer_name}")
print(f"지역: {region}")
print(f"선호 타입: {fav_type}")
```

Three lines, three variables. Describe what kind of screen this makes.

3 · Spot the Bug 🐛

Read what each block is **supposed** to do, fix it on paper, then explain the fix.

Bug A — Every answer should have its spaces trimmed. This one forgets `.strip()` on the region.

```
trainer_name = input("이름: ").strip()
region = input("지역: ")
```

Hint: add the same cleaning step you used for the name.

Write the fixed code:

Why was it wrong? Why does your fix work?

Bug B — When the user leaves the type blank, it should become `비밀`. Right now the check happens *after* the card is printed, so it is too late.

```
fav_type = input("타입: ").strip()
print(f"선호 타입: {fav_type}")

if fav_type == "":
    fav_type = "비밀"
```

Hint: set the default *before* you print.

Write the fixed code:

Why was it wrong? Why does your fix work?

Bug C — The card should print three different fields. Right now it prints the name three times by mistake.

```
print(f"이름: {trainer_name}")  
print(f"지역: {trainer_name}")  
print(f"선호 타입: {trainer_name}")
```

Write the fixed code:

Why was it wrong? Why does your fix work?

4 · Explain the Code

Here is a complete, working trainer card. Read it carefully, then answer the questions.

```
trainer_name = input("트레이너 이름: ").strip()
if trainer_name == "":
    trainer_name = "이름 모를 트레이너"

region = input("어느 지역에서 오셨나요? ").strip()
if region == "":
    region = "이름 모를 지역"

fav_type = input("좋아하는 포켓몬 타입은? ").strip()
if fav_type == "":
    fav_type = "비밀"

print(f"\n=== 트레이너 카드 ===")
print(f"이름: {trainer_name}")
print(f"지역: {region}")
print(f"선호 타입: {fav_type}")
```

What does `.strip()` do to the user's answer, and why do we add it to every `input(...)` line?

Look at the line `if trainer_name == "":`. When is this True, and what does the program do when it is?

This card has three fields. Name them, and name the variable that holds each one.

The first print line has `\n` in it. What does `\n` do to the trainer card on screen?

If the user types nothing for all three questions, what does the finished trainer card show?

5 · Explain Your Lesson Code 🎥

In today's live lesson you wrote your own trainer card. Now explain **the code you wrote** in a short phone video. You may show it running. Teach it like the viewer has never seen it, and use these key words: **variable**, **strip**, **default**, **field**, **trainer card**.

1. Show your code and point to one `input(...).strip()` line — say what the **variable** holds and what `.strip()` does.
2. Point to one `if ... == "":` block and explain the **default** for that **field**.
3. Run your program once and leave a field blank to show the default working.
4. Show your finished **trainer card** on screen and read it out.

Write what you will say in your video. Plan it here before you record.
