

RS001 Week 11 — English Worksheet

Topic: Strategy — Fight or Think? · **Course:** Text Adventure (Python) · **Time:** about 45 minutes

This week the player solves a problem in more than one way. You offer a menu of actions — fight, think, run — and each one leads to a different result. The **order** of your `if` / `elif` / `else` decides which result wins.

```
action = game.ask("Fight or think?").strip().lower()
if action == "fight":
    game.say("You swing your sword!")
elif action == "think":
    game.say("You spot the enemy's weakness!")
else:
    game.say("You hesitate and get hit!")
```

1 · Predict 🧠

Read each piece of code. Before you run it in your head, write what you think happens.

```
action = "think"
if action == "fight":
    game.say("attack")
elif action == "think":
    game.say("clever")
else:
    game.say("oops")
```

Which word is printed?

```
action = "dance"
if action == "fight":
    game.say("attack")
elif action == "think":
    game.say("clever")
else:
    game.say("You freeze in panic.")
```

The player typed something not on the menu. What happens because of the **else** ?

```
actions = ["fight", "think", "run"]
game.say(f"Choose: {actions[0]} / {actions[1]} / {actions[2]}")
```

What menu line is printed?

2 · Spot the Bug 🐛

Each block was meant to do something, but it is broken. Read what it is **supposed** to do, fix it, then explain why the original was wrong.

Bug A — Each action should give a **different** result. Right now "fight" and "think" print the same thing.

```
action = game.ask("do?").strip().lower()
if action == "fight":
    game.say("You win the hard way!")
elif action == "think":
    game.say("You win the hard way!")
```

Hint: the "think" branch should describe a clever win, not a brute-force one.

Write the fixed code:

Why was it wrong? Why does your fix work?

Bug B — There should be a catch-all for answers not on the menu. Right now an off-menu answer prints nothing at all.

```
action = game.ask("fight / think").strip().lower()
if action == "fight":
    game.say("You attack!")
elif action == "think":
    game.say("You outsmart it!")
```

Hint: add an `else` for everything else.

Write the fixed code:

Why was it wrong? Why does your fix work?

Bug C — A wrong answer should get one retry before the game continues. Right now there is no second chance.

```
actions = ["fight", "think", "run"]
action = game.ask("do what?").strip().lower()
if action not in actions:
    game.say("Pick from the menu.")
    game.say(f"You chose: {action}")
```

Hint: after the warning, ask again and store the new answer (reuse what you learned in week 7).

Write the fixed code:

Why was it wrong? Why does your fix work?

3 · Add a Battle Menu

Open your game. When the player meets an enemy, give them a menu: fight, think, run (or your own). Each action should lead to a different outcome. Validate the answer so off-menu input is handled.

When it works, send a **photo or video**, then explain what you did. Use these sentence starters — write 4 to 6 sentences total.

First, the enemy appeared and I offered the actions ...

Fighting led to ...

Thinking led to ...

Running led to ...

One tricky moment was when ...

If I had more time, I would ...

4 · Record Your Walkthrough 🎥

Take a video on your phone (or a parent's phone) while your battle runs. Teach it like the viewer has never coded. Try to use these words: **action**, **menu**, **elif**, **else**, **outcome**.

1. Run your game and fight the enemy.
2. Run it again and think instead — show the different result.
3. Type something off-menu and show what happens.
4. Read your `if` / `elif` / `else` out loud and explain why order matters.

Write what you will say in your video. Plan it here first.
