

RS002 Week 5 — English Worksheet

Topic: Cleaning Input — `.strip()` and `.lower()` · **Course:** Pokédex App · **Time:** about 45 minutes

This week your Pokédex lets the trainer **search by name**. But people type messily — extra spaces, mixed capitals. You clean their input with `.strip()` and `.lower()` so the search still works, then use `if` / `elif` / `else` to react to the choice.

1 · Recall

From memory:

Write a `for` loop that prints every name in a list called `names` .

2 · Predict 🌟

Read each block. Before you run it, write what you think will happen.

```
choice = "  Pikachu  "
choice = choice.strip()
print(f"[{choice}]")
```

What prints between the brackets, exactly?

```
choice = "PIKACHU"
choice = choice.lower()
print(choice)
```

What does `.lower()` turn the text into?

```
choice = input("이름: ").strip().lower()

if choice == "pikachu":
    print("⚡ 피카츄!")
else:
    print("없는 포켓몬")
```

The user types `Pikachu`. Does the `if` match? Why or why not?

3 · Spot the Bug 🐛

Read what each block is **supposed** to do, fix it, then explain the fix.

Bug A — This should match even if the user types extra spaces. Right now `" pikachu"` does not match.

```
choice = input("이름: ").lower()

if choice == "pikachu":
    print("찾음!")
else:
    print("못 찾음")
```

Hint: spaces are still there — clean them too.

Write the fixed code:

Why was it wrong? Why does your fix work?

Bug B — This should match whether the user types `Pikachu`, `PIKACHU`, or `pikachu`. Right now only the exact lowercase word works.

```
choice = input("이름: ").strip()

if choice == "pikachu":
    print("찾음!")
else:
    print("못 찾음")
```

Hint: make both sides lowercase before comparing.

Write the fixed code:

Why was it wrong? Why does your fix work?

Bug C — This should show a different message for each of three Pokémon, and one message for anything else. Right now the last branch runs even for known Pokémon.

```
choice = input("이름: ").strip().lower()

if choice == "pikachu":
    print(" ⚡ 피카츄!")
if choice == "bulbasaur":
    print(" 🌿 이상해씨!")
else:
    print("없는 포켓몬")
```

Hint: the second check should be `elif`, not a fresh `if`.

Write the fixed code:

Why was it wrong? Why does your fix work?

4 · Modify It

Start from this working search:

```
pokemon_names = ["pikachu", "bulbasaur", "charmander"]
choice = input("Enter Pokémon name: ").strip().lower()

if choice == "pikachu":
    print("⚡ 피카츄를 골랐어요!")
elif choice == "bulbasaur":
    print("🌿 이상해씨를 골랐어요!")
elif choice == "charmander":
    print("🔥 파이어를 골랐어요!")
else:
    print("그 포켓몬은 도감에 없어요.")
```

Make these changes one at a time and run after each:

1. Add a fourth branch for `squirtle` (꼬부기).
2. Change the `else` message to suggest the trainer try again.
3. Remove the `.lower()` and test typing `PIKACHU` — see what breaks. Then put it back.

Write your changed / added lines here:

5 • Make It

Add a **search feature** to your Week 4 Pokédex. The trainer types a name; you clean it with `.strip().lower()` ; then you tell them which Pokémon they picked, or that it is not in the dex.

When it works, send a **photo or video** on KakaoTalk, then explain what you did. Use these starters — write 4 to 6 sentences.

First, I asked the trainer to type ...

I cleaned their input with ... so that ...

```
.strip() handled ... and .lower() handled ...
```

I used `if` / `elif` / `else` to ...

The trickiest part was ...

Cleaning input matters because real people type ...

6 · Record Your Walkthrough 🎥

Film your search running. Teach it like the viewer is new. Try to use: **strip, lower, clean, if / elif / else, search.**

1. Run your search and type a name with extra spaces and capitals.
2. Show it still works, then explain which method fixed the spaces and which fixed the capitals.
3. Read your `if / elif / else` out loud.
4. Type a Pokémon that is not in the dex and show the `else` message.

Plan what you will say here first:
