

⚙️ RS003 Week 2 — English Worksheet

Topic: FPS, Title, and a Colour-Cycling Background · **Course:** Pygame Turret · **Time:** about 45 minutes

This week you make last week's window feel **alive**. You add a **clock** to control the frame rate (FPS), give the title bar a nicer name, and make the background colour slowly change over time.

💬 Words to know: **clock**, **FPS (frames per second)**, **frame**, **tick**, **modulo (%)**

1 · Predict 🧠

Read each piece of code. Before you run it, write what you think will happen.

```
clock = pygame.time.Clock()
FPS = 60
clock.tick(FPS)
```

What does `clock.tick(60)` do to the speed of the game loop?

```
frame_count = 0
r = (frame_count * 1) % 256
frame_count = frame_count + 1
```

`frame_count` goes up by 1 every loop. What does `% 256` do when it reaches 256?

```
r = (frame_count) % 256  
g = 100  
b = (200 - frame_count) % 256  
screen.fill((r, g, b))
```

Red is climbing and blue is falling, while green stays still. Describe how the background colour changes as time passes.

2 · Run It 🏃

🎯 Type the example, run it, and watch the colours move

```
import pygame
pygame.init()

WIDTH, HEIGHT = 800, 600
screen = pygame.display.set_mode((WIDTH, HEIGHT))
pygame.display.set_caption("⚙️ My Turret Game v2 – 60 FPS")

clock = pygame.time.Clock()
FPS = 60
frame_count = 0

running = True
while running:
    for event in pygame.event.get():
        if event.type == pygame.QUIT:
            running = False

    r = (frame_count) % 256
    g = 100
    b = (200 - frame_count) % 256

    screen.fill((r, g, b))
    pygame.display.flip()

    clock.tick(FPS)
    frame_count = frame_count + 1

pygame.quit()
```

Watch for 10 seconds. What does the background do?

3 · Spot the Bug 🐛

Each block below was meant to do something but is broken. Fix it, then explain why the original was wrong.

Bug A — This game runs fine but your computer's fan gets loud and the CPU hits 100%.

```
running = True
while running:
    for event in pygame.event.get():
        if event.type == pygame.QUIT:
            running = False
    screen.fill((100, 100, 200))
    pygame.display.flip()
```

Hint: without a clock, the loop runs as fast as it possibly can.

Write the fixed code (show the loop):

Why was it wrong? Why does your fix work?

Bug B — The background should cycle colours, but the program crashes with an error about a colour value being too big.

```
r = frame_count
screen.fill((r, 100, 50))
```

Hint: colour numbers must stay between 0 and 255. `frame_count` keeps growing past 255.

Write the fixed code:

Why was it wrong? Why does your fix work?

Bug C — The colour is supposed to keep changing, but it is stuck on one colour forever.

```
frame_count = 0
running = True
while running:
    for event in pygame.event.get():
        if event.type == pygame.QUIT:
            running = False
    r = frame_count % 256
    screen.fill((r, 100, 100))
    pygame.display.flip()
    clock.tick(60)
```

Hint: the frame counter never goes up.

Write the fixed code:

Why was it wrong? Why does your fix work?

4 · Modify It

Compare 30, 60, and 120 FPS

Change **FPS** to 30, run it, then to 60, then to 120. Watch how fast the colours move each time.

Write what changed between 30, 60, and 120 FPS:

Invent your own colour formula

Right now red rises and blue falls. Change the formulas so the colours change in your own way. For example, make the screen slowly get darker, or make green move too.

Write the formulas you used for r, g, and b:

Hint: any formula works as long as you wrap the result in **% 256** so it stays a valid colour.

5 · Make It

Tune your own living background

Make a window that:

1. runs at a steady frame rate using a clock,
2. has your own title in the bar,
3. slowly changes its background colour with your own formula.

When it works, send a **photo or video** of your moving background, then explain what you did. Use these sentence starters — write 4 to 6 sentences total.

First, I added a clock so the loop ...

I set the FPS to ... because ...

My colour formula makes the screen ...

I used % 256 to make sure ...

One tricky moment was when ...

If I had more time, I would ...

6 · Record Your Walkthrough

Take a video while your background cycles. Talk through it like you are teaching someone. Try to use these words: **clock**, **FPS**, **frame**, **tick**, **modulo**.

1. Show the background slowly changing colour.
2. Read your colour formula out loud and say what makes it change.
3. Show what happens to the speed when you change FPS.
4. Say why `clock.tick` matters for your computer.

Write what you will say in your video. Plan it here before you record.
