

RS001 Week 9 — English Worksheet

Topic: Cause and Effect — Enemies Appear · **Course:** Text Adventure (Python) · **Time:** about 45 minutes

This week one choice changes what happens next. `if` / `else` lets you run different code depending on the player's path — so the **left** road meets a goblin and the **right** road meets an orc.

```
path = game.ask("Which way? (left/right)").strip().lower()
if path == "left":
    enemy = "goblin"
else:
    enemy = "orc"
game.say(f"A {enemy} appears!")
```

1 · Predict 🧠

Read each piece of code. Before you run it in your head, write what you think happens.

```
path = "left"
if path == "left":
    game.say("cave")
else:
    game.say("field")
```

Which word is printed?

```
paths = ["left", "right"]
enemies = ["goblin", "orc"]
path = "right"
if path == paths[0]:
    game.say(enemies[0])
elif path == paths[1]:
    game.say(enemies[1])
```

Which enemy is printed, and which branch ran?

```
path = "up"
if path == "left":
    game.say("goblin")
elif path == "right":
    game.say("orc")
```

The player typed **"up"** . What appears on screen?

2 · Spot the Bug 🐛

Each block was meant to do something, but it is broken. Read what it is **supposed** to do, fix it, then explain why the original was wrong.

Bug A — Left should give a goblin and right should give an orc. Right now **both** paths give a goblin.

```
path = game.ask("way?").strip().lower()
if path == "left":
    enemy = "goblin"
if path == "right":
    enemy = "goblin"
game.say(f"A {enemy} appears!")
```

Hint: the second branch has the wrong enemy.

Write the fixed code:

Why was it wrong? Why does your fix work?

Bug B — The second branch should be an `elif`, not a fresh `if`, so the two choices are linked as one decision.

```
path = game.ask("way?").strip().lower()
if path == "left":
    game.say("A goblin blocks the cave.")
else path == "right":
    game.say("An orc roams the field.")
```

Hint: the word after the first branch should be `elif`.

Write the fixed code:

Why was it wrong? Why does your fix work?

Bug C — The enemy's name and HP should come from the **same** index. Here the name is from the left path but the HP is from the right.

```
paths = ["left", "right"]
enemies = ["goblin", "orc"]
enemy_hp = [10, 25]
path = "left"
if path == paths[0]:
    game.say(f"{enemies[0]} (HP {enemy_hp[1]})")
```

Hint: match the index across all three lists.

Write the fixed code:

Why was it wrong? Why does your fix work?

3 • 🎯 Branch Your Story

Open your game. After your validated path choice, make the path **matter**: each direction should meet a different enemy. Use `if / else` (or `elif`) and describe each encounter so it feels different.

When it works, send a **photo or video**, then explain what you did. Use these sentence starters — write 4 to 6 sentences total.

First, I asked the player to choose a path, and ...

If they went left, the game ...

If they went right, the game ...

The cause was the choice and the effect was ...

One tricky moment was when ...

If I had more time, I would ...

4 · Record Your Walkthrough 🎥

Take a video on your phone (or a parent's phone) while your game runs. Teach it like the viewer has never coded. Try to use these words: **if**, **else**, **branch**, **cause**, **effect**.

1. Run your game and take the left path.
2. Run it again and take the right path.
3. Show that each choice leads to a different enemy.
4. Read your `if` / `else` out loud and explain which branch runs when.

Write what you will say in your video. Plan it here first.
